

## Real Estate Buying/Selling System

The application offers the user the possibility to search through a list of property listings (houses, apartments, etc.). The user can select an ad from the list and view details about it: price, size, number of rooms, number of bathrooms, parking space, etc. The user can add the ad to favorites or purchase the property, at which point the ad is removed from the list. In a subsequent run, the user can search for ads from the initial list or from their favorites list.

I will be doing this project in collaboration with Alexandru Marusteri.
